

Fish Habitat

Improving fish habitat is one of our Association's priorities. As of 2007 we placed 23 fish cribs in the flowage. We obtained permits from the DNR and also followed all their specific requirements. This included using green oak logs resulting in an 8' x 8' x 4' high structure placed in deep water. Holes are drilled near the end of each log with metal rebar going up through these logs to hold them together. Logs were also tied together with heavy duty

aluminum wire, as were the tree limbs within this structure and the many cement blocks that were also used. All work was some by volunteers and many of the materials were donated by area businesses. We are exploring a range of other means to further improve the fish habitat in this flowage.
